

Audit completion report

4 October 2026 • Full implementation and regression review

Implemented and verified as a challenge simulation. Every audit recommendation is mapped below. Live deployment and research gates are stated explicitly; selection is not promised.

Student experience

Audit recommendation	Implemented result / evidence
Make the free workshop immediately clear	Outcome-led homepage explicitly says free, online, 60 minutes • Home desktop/mobile screenshots
Add direct registration	Visible registration links bypass the matcher • Browser signup flow; `/register`
Narrow the primary campaign segment	Growth plan targets final-year CSE/IT/AI-ML students with basic programming and an unfinished AI portfolio • Two-page growth plan
Shorten and make diagnosis optional	Three questions: target role, skills, AI experience; skip-to-register link • Browser matcher flow
Respect existing AI experience	Experienced students receive testing/explanation guidance rather than a fabricated missing-project claim • Domain test and reveal screenshot
Remove unsupported readiness scoring	Score is no longer displayed; compatibility result field is zero and no employability assessment is claimed • Matcher/results source; domain test
Provide concrete Project DNA value	Three input/output previews, prerequisites, build scope, takeaway, and explicit limitations • Project workbench; starter ZIP
Bound the 60-minute project promise	SQL helper, computed dataset summary, traceable feedback themes; guided prototypes only • Project catalog and preview copy
Give the Builder Reveal practical value	Saved-session workshop pass, downloadable preparation checklist and starter kit • Pass screenshot; browser reload test
Calendar action	ICS export implemented, shown only for an organizer-configured date • Calendar unit test; unconfigured route returns 409
Make squads optional	Registration completes independently; solo path remains available • Browser and integration flows
Make team roles meaningful	Builder connects, Solver checks, Shipper documents • Squad screenshot
Make invitations project-specific	Project output and open roles, direct registration, separate optional matching • Invite screenshot

Growth, product and submission

Audit recommendation	Implemented result / evidence
Preserve invalid/full/network states	Retry and independent-registration exits; full joins conflict without invalidating registration • API integration checks; invite UI
Replace dashboard storytelling with decisions	Editable reach, conversion, overlap, sharing, delivery assumptions, forecast, gap and reserve • Baseline/downside browser interaction
Explain 500 and INR 2,000	300 campus + 125 community + 75 referrals; four capped budget allocations • Forecast tests; two-page plan
Explain acquisition and operating plan	Two prioritized distribution channels, optional peer loop, pilot and seven-day sequence • Plan; Command Center
Expose downside and recovery	20% campus conversion yields 382; 118 gap; conservative additional-contact estimate • Arithmetic regression test
Separate forecasts, simulations, and observations	Fixed illustrative data is labeled; configured live reads contain no seeded values • Metrics source and outage test
Correct K-factor inconsistency	Explicit referral contribution replaces unsupported viral interpretation • Metrics consistency test
Avoid counting shares as deliveries	Share actions named accurately; delivery remains an assumption • Dashboard definitions
Clean student navigation	Projects, How it works, Register; secondary Explore and evaluator links • Desktop/mobile screenshots
Establish a distinctive visual system	Charcoal/lime workbench, large outcome typography, project output, build timeline and pass • Screenshot evidence
Mobile and accessibility basics	Responsive tested pages, labeled form controls, focus styles, skip link, error/status regions and reduced-motion CSS • Browser overflow checks and visual review
Package the challenge submission	Two-page PDF, learning notes, captioned 3:00 walkthrough, narration script, evaluator hub • `/submission`; downloadable assets

Additional integrity corrections

Fail-closed writes; transactional registration; unique email/user/builder assignment; signed HttpOnly sessions; locked squad joins and unique roles; real demo invite lookup; paginated and deduplicated metrics; validated attribution; analytics PII allowlist; bounded requests; server consent validation; reset of both cookie and local state; builds independent of external Google Fonts downloads.

What was verified

PASS — Production webpack build, full-repository ESLint and TypeScript passed.

PASS — Seven domain tests passed: forecast, downside/overlap, malformed bounds, unique stage counting, consistent metrics, experienced guidance and calendar.

PASS — Production-server integration passed: nine pages, input/consent validation, session restore, idempotent retry, authorization, invalid invites, concurrent demo capacity, unique roles, duplicate joins, tampered cookie, CSRF, JSON/body-size limits, calendar guard and reset.

PASS — Configured-live outage injection passed: registration, metrics and squad creation return 503, not invented success or seeded counters.

PASS — Desktop browser flow passed: output preview, matcher, experienced guidance, registration, pass reload, optional squad, invite preview and changed forecast. No page exceptions.

PASS — Mobile home, registration and dashboard passed 390px horizontal-overflow checks; screenshots inspected.

PASS — Starter parses; Python statistics correctly compute 75% change and a 20-unit increase. Growth plan rendered and inspected. Captioned video generated from tested app screenshots and checked at exactly 180 seconds.

Deployment gates still open

No staging database credentials were supplied. Apply duplicate preflight and migration once, then verify live transaction concurrency. Demo concurrency is not proof of database deployment.

Configure a stable signing secret and server-only service key. A distributed public deployment needs a shared edge rate limiter. Demo memory is deliberately ephemeral.

Confirm the real event date, meeting link, organizer contact and retention/deletion process before collecting participants. Calendar is implemented but guarded until a date is supplied.

No student interviews, partners, outreach, conversion lift or 500 registrations are claimed. The plan remains a hypothesis to pilot.

A captioned three-minute walkthrough and personal narration script are supplied. No challenge form has been submitted.

Arithmetic correction

The verbal audit previously claimed 400 at 20% campus conversion. Correct calculation: 200 campus + 125 community + about 57 referrals = 382. Code, tests and materials use 382.

Evidence from the tested app

Desktop workbench and workshop pass. Screenshots use fictional demo details.

NXTWAVE GROWTH CHALLENGE / WORKING SIMULATION

Leave with something *you can demo.*

Build your first AI project in a **free, 60-minute online workshop**. Find a project that fits your skills—or register straight away.

[Find my project →](#)[Register for the workshop](#)

For final-year engineering students. Guided starter code. Attend solo or bring a friend. Workshop schedule will be announced.

✓ One useful output ✓ Three test cases ✓ A demo you can explain

INSIDE THE BUILD

INPUT → PROOF

01 / SOFTWARE

PREPARED EXAMPLE

AI SQL Debugging Copilot

Turn a broken query into a correction you can explain.

INPUT

```
SELECT name FROM students
WHERE branch = CSE;
```

Schema: students(name TEXT, branch TEXT)

↓

✓ Hide example output

EXAMPLE OUTPUT / CHECKED

```
SELECT name FROM students
WHERE branch = 'CSE';
```

CSE is a text value. Wrap it in single quotes, then test the query against the supplied schema.

A fixed preview to explain the build. This button does not run an AI model.

A prepared example, not a live model response. Your workshop build adds the interface, checks, and explanation.
